

Application Serial No. 10/645,916

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

**Claim 1.** (Currently amended) A fence spacer for maintaining a pair of fence wires in a desired common plane and spaced a desired distance apart, the spacer comprising a substantially non-flexing spacer body having first and second parallel edges positionable to be oriented substantially parallel to the desired common plane of the wires; a first pair of generally S-shaped tabs along the first edge; a second pair of generally S-shaped tabs along the first edge and spaced apart from the first pair of tabs; a third pair of generally S-shaped tabs located along the second edge; and a fourth pair of generally S-shaped tabs along the second edge and spaced apart from the third pair of tabs, wherein the spacer is installed by snap-fitting the first and second pair of tabs onto a first one of the wires and snap-fitting the third and fourth pair of tabs onto a second one of the wires, with the first and second pairs of tabs maintaining the first wire closely adjacent the first edge and the third and fourth pairs of tabs maintaining the second wire closely adjacent the second edge.

**Claim 2.** (Original) The fence spacer of claim 1, wherein each tab defines a channel for cradling a portion of the wire.

**Claim 3.** (Original) The fence spacer of claim 1, wherein the spacer body is generally X-shaped.

**Claim 4.** (Original) The fence spacer of claim 1, wherein the spacer body is generally rectangular.

**Claim 5.** (Original) The fence spacer of claim 1, further comprising first, second, third, and fourth arms extending from the spacer body, with the first pair of tabs extending from the first arm, the second pair of tabs extending from the second arm, the third pair of tabs extending from the third arm, and the fourth pair of tabs extending from the fourth arm.

Application Serial No. 10/645,916

Claim 6. (Original) The spacer of claim 1, wherein the fence spacer is usable to space electric fence wires consisting of a ground wire and an electrically powered wire, and wherein one of the tabs of the first pair of tabs is electrically conductive and one of the tabs of the third pair of tabs is electrically conductive, and the spacer further comprises an electrically powerable light source positioned adjacent the spacer body, a first conductor extending between the electrically conductive tab of the first pair of tabs and the light source and a second conductor extending between the electrically conductive tab of the third pair of tabs and the light source, wherein when the fence is functioning the light will be illuminated.

Claim 7. (Original) A fence spacer for maintaining a pair of fence wires in a desired common plane and spaced a desired distance apart, the spacer comprising a spacer body and a plurality of first loops configured to cradle a first one of the fence wires and a plurality of second loops configured to cradle a second one of the fence wires

Claim 8. (Original) The spacer of claim 7, further comprising a plurality of slots extending through the spacer body, wherein each of the first and second loops substantially spans one of the slots.

Claim 9. (Original) The fence spacer of claim 7, wherein the spacer body is generally X-shaped.

Claim 10. (Original) The fence spacer of claim 7, wherein the spacer body is generally rectangular.

Claim 11. (Original) A fence spacer for maintaining a pair of fence wires in a desired common plane and spaced a desired distance apart, the spacer comprising a spacer body having first and second parallel edges positionable to oriented to be substantially parallel to the desired common plane of the wires; a first wire retaining member along the first edge; a second wire retaining member along the first edge and spaced apart from the first wire retaining member; a third wire retaining member located along the second edge; and a fourth wire retaining member

Application Serial No. 10/645,916

along the second edge and spaced apart from the third wire retaining member, wherein the spacer is installed by snap-fitting the first and second wire retaining members onto a first one of the wires and snap-fitting the third and fourth wire retaining members onto a second one of the wires, with the first and second wire retaining members maintaining the first wire closely adjacent the first edge and the third and fourth wire retaining members maintaining the second wire closely adjacent the second edge.

Claim 12. (Original) The spacer of claim 11, wherein the wire retaining members comprise S-shaped tabs.

Claim 13. (Original) The spacer of claim 11, wherein the wire retaining members comprise loops for cradling the wires.

Claim 14. (Original) The spacer of claim 11, wherein the fence spacer is usable to space electric fence wires consisting of a ground wire and an electrically powered wire, and wherein the first and third wire retaining members are electrically conductive, and the spacer further comprises an electrically powerable light source positioned adjacent the spacer body, a first conductor extending between the first wire retaining member and the light source and a second conductor extending between the third wire retaining member and the light source, wherein when the fence is functioning the light will be illuminated.

Claim 15. (New) A fence spacer for maintaining a ground wire of a fence and an electrically powered wire of a fence in a desired common plane and spaced a desired distance apart, the spacer comprising a spacer body having first and second parallel edges positionable to be oriented substantially parallel to the desired common plane of the wires; a first pair of generally S-shaped tabs along the first edge, one of which is electrically conductive; a second pair of generally S-shaped tabs along the first edge and spaced apart from the first pair of tabs; a third pair of generally S-shaped tabs located along the second edge, one of which is electrically conductive; a fourth pair of generally S-shaped tabs along the second edge and spaced apart from the third pair of tabs, an electrically powerable light source positioned adjacent the spacer body,

Application Serial No. 10/645,916

a first conductor extending between the electrically conductive tab of the first pair of tabs and the light source and a second conductor extending between the electrically conductive tab of the third pair of tabs and the light source, wherein the spacer is installed by snap-fitting the first and second pair of tabs onto a first one of the wires and snap-fitting the third and fourth pair of tabs onto a second one of the wires, with the first and second pairs of tabs maintaining the first wire closely adjacent the first edge and the third and fourth pairs of tabs maintaining the second wire closely adjacent the second edge such that when the fence is functioning the light will be illuminated.

Claim 16. (New) A fence spacer for maintaining a ground wire and an electrically powered wire of a fence in a desired common plane and spaced a desired distance apart, the spacer comprising a spacer body having first and second parallel edges positionable to oriented to be substantially parallel to the desired common plane of the wires; a first wire retaining member along the first edge and being electrically conductive; a second wire retaining member along the first edge and spaced apart from the first wire retaining member; a third wire retaining member located along the second edge and being electrically conductive; a fourth wire retaining member along the second edge and spaced apart from the third wire retaining member, an electrically powerable light source positioned adjacent the spacer body, a first conductor extending between the first wire retaining member and the light source, and a second conductor extending between the third wire retaining member and the light source, wherein the spacer is installed by snap-fitting the first and second wire retaining members onto a first one of the wires and snap-fitting the third and fourth wire retaining members onto a second one of the wires, with the first and second wire retaining members maintaining the first wire closely adjacent the first edge and the third and fourth wire retaining members maintaining the second wire closely adjacent the second edge such that when the fence is functioning the light will be illuminated.
